

Madison: During this project, I utilized Google Gemini AI as a technical assistant to streamline deployment and troubleshooting. Through a mixture of research (online forums, YouTube) and Gemini, I received guidance on coordinating environment setups across Render, Clever Cloud, and our local host. Additionally, Gemini helped draft and structure a custom Dockerfile. It was also used to diagnose errors and accelerate the debugging and design process across API and service code.

Ire: I wrote the logic for `addItem()`, `deleteItem()`, and `clearCart()` in `shoppingCart.java`, based on the classes existing structure and the test cases in phase 1. I used Claude as a support tool during this process, mainly to catch syntax errors and confirm my code would compile correctly with the existing JPA annotations. It also helped me double check edge cases, like handling an unavailable product or an empty cart, against my original test case requirements. The final code was committed to the repository and reviewed.

Georgie: The main coding portion that I completed was the `Order` and `OrderHistory` classes. Both classes were fairly straightforward in their implementation, though the `OrderHistory` logic migrated to the `OrderRepository` to make the most use out of the Spring Java JPA. I was not very familiar with the `Comparator` logic that was needed to sort the list object that was created in the original `OrderHistory` class and used ChatGPT to explain how the function was used and the syntax that would be required for our purposes. As I have never worked on a web application before, I also used ChatGPT to help me get a better understanding of how the API controller was used and how it connected to the model classes that we had initially created during the UML design portion of the project.

Leigh: Throughout the project I mainly used ChatGPT and Claude to help with troubleshooting code to find syntax errors and general idea/layout composition. Most of the user stories were simple to think of when creating a grocery store portal, but a few of the user stories were added on by ChatGPT. I had also never worked on a web application so I had Claude help me out with the API controller test. Everything else I contributed was researched through [google/stackoverflow](https://www.google.com/search?q=stackoverflow).
